### Benchmarks

# Design guided by measured performance.

## Covered:

- $\bullet$  Benchmarks. (1.5)
- Measures of performance. (1.5, 1.6)
- Principles and measured performance. (1.6)

Qualitative Computer Design

EE 4720 Lecture Transparency. Formatted 14:43, 17 January 1997 from Isli02.

• Example: Memory. (1.7)

(Numbers refer to book sections.)

#### Benchmark:

program used to evaluate performance.

### Uses

- Guide computer design.
- Guide purchasing decisions.
- Marketing tool.

#### Guiding Computer Design

Measure overall performance.

Determine characteristics of programs. E.g., frequency of floating-point operations.

EE 4720 Lecture Transparency. Formatted 14:43, 17 January 1997 from Isli02.

Determine effect of design options.

Choosing Benchmark Programs		Options:	
Important: Choice of programs for evaluation.		Real Programs Programs chosen using surveys, for example.	
Optimal but unrealistic:		+ Measured performance improvements apply to customer.	ilt.)
The exact set of programs customer will run.		- Large programs hard to run on simulator. (Before system built.)	
Problem: computers used for different applications.	Kernels		
Therefore, must model typical users' workload.		Use part of program responsible for most execution time.	
		+ Easier to study. – Not all program have small kernels.	
		Toy Benchmarks	
		Program performs simplified version of common task.	
		+ Easier to study.	
		– May not be realistic.	
		Synthetic Benchmarks Program "looks like" typical program, but does nothing useful.	
		+ Easier to study. – May not be realistic.	
		Commonly Used Option	
		Overall performance: real programs	
		Test specific features: synthetic benchmarks.

Benchmark Suites		Ex	Example, SPEC 95 Suites		
Definition: a named set of programs used to evaluate a system.			Respected measure of CPU performance.		
<ul> <li>Typically:</li> <li>Developed and managed by a publication or non-profit org- zation.</li> <li>E.g., Standard Performance Evaluation Corp., PC Magazin</li> </ul>			Managed by Standard Performance Evaluation Corporation, a non-profit organization funded by computer companies. Measures CPU and memory performance on integer and FP code.		
• Tests clearly delineated aspects of system. E.g., CPU, graphics, I/O, application.		Uses common Unix programs such as perl, gcc, compress.			
• Specifies a set of programs and inputs for those programs.			Requires that results on each program be reported.		
• Specifies reporting requirements for results.			Programs compiled with publicly available compilers and libraries.		
What Suites Might Measure			Programs compiled with and without expert tuning.		
• Application Performance <i>E.g.</i> , productivity (office) applications, database programs. Usually tests entire system.			SPEC 95 Suites and Measures		
• CPU and Memory Performance Ignores effect of I/O.		CINT95 suite of integer programs run to determine: • SPECint95, execution time of tuned code.			
• Graphics Performance			• SPECint-base95, execution time of untuned code.		
			• SPECint_rate95, throughput of tuned code.		
			CFP95 suite of floating programs run to determine:		
			• SPECfp95, execution time of tuned code.		
			$\bullet$ ${\rm SPECfp\_base95},$ execution time of untuned code.		
			• SPECfp_rate95, throughput of tuned code.

02-7

Other Examples

02-7

BAPCO Suites, measure productivity app. performance on Windows 95.

TPC, measure "transaction processing" system performance.

WinMARK, graphics performance.

02-8

Reporting Results

Options for Combining Performance of Suite Members (This is harder than it sounds.)

Let n denote number of programs in suite.

Let  $t_i$  denote run time of program i.

Run times of suite members combined using:

• Arithmetic Mean of Execution Times

$$\frac{1}{n}\sum_{i=1}^{n}t_{i}.$$

Emphasizes programs with longest running time.

 $\bullet$  Weighted Arithmetic Mean

Let  $w_i \in [0, 1]$  be weight (importance) of program i,

where  $\sum_{i=1}^{n} w_i = 1$ .

The weighted arithmetic mean is given by:

 $\sum_{i=1}^n w_i t_i.$ 

Emphasizes programs based on importance to users.

• Harmonic Mean of Execution Times

 $\left(\frac{1}{n}\sum_{i=1}^n \frac{1}{t_i}\right)^{-1}.$ 

Emphasizes programs with shortest running time.

How Execution Time Reported By OS				Components of CPU Performance		
Total Run Time Called			CPU I	Performance Decomposed into Three Components:		
• Elapsed Time				Clock Frequency $(\phi)$		
• Response Time				Determined by technology and influenced by organization.		
• Wall-Clock Time				Clocks per Instruction (CPI) Determined by organization.		
During execution CPU may be in:	1ay be in:		• Instruction Count (IC)			
• User mode: Possibly running "our"	oly running "our" program.			Determined by program and ISA.		
• System mode: Possibly running OS	for our program.		Execution time = $\frac{1}{\phi} \times \text{CPI} \times \text{IC}$ .			
• In user or system mode running som	neone else's program.			٣		
• Idle.						

Reported by Unix time Utility

For a particular program (process):

- User Time
- System Time
- Elapsed Time

Additional Performance Measures Using Above

Call a system running benchmark program only, unloaded.

# System Performance:

Elapsed time on an unloaded system.

### CPU Performance:

Sum of User and System time on an unloaded system.

02-11 02-12

# Principles of Computer Design

Principles computer designers apply widely.

- Make the common case fast. Obviously.
- Amdahl's Law: Don't make common case too fast. As speed of one part increases... ...impact on total performance drops.
- Locality of Reference. *Temporal:* It might happen again soon. *Spatial:* It might happen to your neighbors soon too.

02-13 EE 4720 Lecture Transparency. Formatted 14:43, 17 January 1997 from Isli02.
