Offered by:

David M. Koppelman

3191 P. F. Taylor Hall, 578-5482, koppel@ece.lsu.edu, <http://www.ece.lsu.edu/koppel>

Office Hours: Monday - Friday, 14:00-15:00.

Should already know:

How to design a computer.

Will learn:

How to design a *good* computer.

Prerequisites By Course:

EE 3755, Computer Organization.

Prerequisites By Topic:

- Logic design.
- Computer organization.
- Assembly-language programming.

Optional Text

“Computer architecture, a quantitative approach,” John L. Hennessy & David A. Patterson,
or “Computer organization & design,” David A. Patterson & John L. Hennessy.

Course Content

- Basic pipelining techniques.
- Increased datapath speed: superscalar and VLIW (both wider), and deeper pipelines.
- Branch prediction and related techniques.
- Basic parallel computer organizations: cluster, multi-core.
- Dynamic scheduling.
- Caches and memory.

Topics cover modern general-purpose microprocessors.

Midterm Exam, 40%

Fifty minutes, closed book.

Final Exam, 40%

Two hours, closed book.

Yes, it's cumulative.

Homework, 20%

Written and computer assignments.

Lowest grade or unsubmitted assignment dropped.

Material in Course Needed For:

- General-purpose processor designers and testers.
- Special-purpose processor designers and testers.
- Compiler writers.
- Programmers of high-performance systems, including games.
- Answering job interview questions.

Course Resources

- Slides and other material via <http://www.ece.lsu.edu/ee4720/>
- Web site also has homework assignments, exams, grades, and other material.
- Announcements are on course home page and available as a Web (RSS) Feed.

Key Concept: Split computer design into *Architecture Design* and *Implementation*.

Medieval Innovation: Standardized parts.

Example: Nuts and bolts.

Before standardization: Each nut and bolt a unique pair.

Advantage of standard:

Can replace nut without replacing bolt.

Standardization Questions

Which size?

Specify exact metal, or just properties.

Computer Standards

Plethora of standards: USB, HTML, PCI Express, IA-32 (x86-32),

IA-32 example of *Instruction-Set Architecture*

Quick (and Temporary) Definitions

Instruction Set Architecture (ISA):

The Machine Language

Examples: IA-32, Itanium, PowerPC.

ISA and Nuts & Bolts

ISA: Standard Size

Nut: Software

Bolt: *Implementation* (CPU)

Implementation:

The Chip

Examples: Intel Core, Athlon, G5.

An ISA can have multiple implementations ...
... sometimes developed decades apart.

Early Computer Design

ISA and Implementation not considered totally separate things.

Start with requirements. (*E.g.*, Need division instructions.)

Develop processor hardware.

ISA is documentation of “implementation” (developed hardware).

Problems Faced by Early Computer Manufacturers

Realization that software development expensive & time-consuming.

Would like to offer past customers better machine that runs old software.

Engineers say a really better machine would break old software.

Marketing people rather not test customers' loyalty, so don't break sw.

ISA and IBM System/360

Concept of ISA crystallized by Amdahl, Blaauw, & Brooks.

Engineers designed ISA and implementation as separate entities.

ISA would ease development of new implementations.

System/360 developed in 1964 and its successors are still available.

Instruction Set Architecture (ISA):

Precise definition of computer's instructions and their effects.

It's all that programmer needs to program machine.

It's all that hardware designer needs to design machine.

Implementation: [of an ISA] (noun)

Hardware that executes instructions defined by the ISA.

Microarchitecture:

Organization and features used for an implementation.

ISA and implementation descriptions at

<http://www.ece.lsu.edu/ee4720/reference.html>.

What a Typical ISA Defines

Instructions. (Operations, encoding, etc.)

Data Formats (Integer, Floating Point, Vector/Packed)

Registers and Memory Organization.

Interrupts, exceptions, and traps.

Implementation-Dependent Features. (Memory control, custom features.)

ISA Design Goals

- Define what program is. (Instructions and their encodings.).
- Define what program will do. (Data types, operations.)
- Clearly distinguish defined, undefined, and implementation-dependent behavior.
- Enable good first implementation.

Easy.

- Enable good future implementations.

Requires foresight: See future needs and technology (*e.g.*, gates).

Requires discipline: Sacrifice first-implementation performance.

And maybe foolishness: Insufficient first-implementation sales.

How Damaging (to profit) Are Bad ISAs?

Examples of Bad (now) ISA Features

- Undefined FP rounding behavior. System/360
- Base + 16-Bit Offset Addressing. (IA-32)
- Not enough registers. (IA-32)
- Overly complex instructions. (VAX)

Bad features can be overcome by implementation...
... especially if engineering budget is very large.

Architecture: IBM *System/360*

Developed in 1964 for large business computers.

Designers appreciated and popularized the difference between ISA and implementation.

First planned family of computers.

Very successful, successor machines still in use under name z/Architecture.

First Implementations: Model 30, Model 75.

Architecture: DEC VAX

Developed by the Digital Equipment Corporation.

First implementation: VAX 11/780, introduced in 1978.

Came to dominate *minicomputer* market in 1980s.

Single-chip implementations were developed but not successful.

Later DEC developed the Alpha ISA, more suitable to 1990s technology.

Architecture: Intel *IA-32*

Initially developed in 1978 for small systems.

First processor: 8086, implements small part of IA-32.

Major improvements in amount of memory addressable by subsequent chips, 80186, 80286 (1982).

The 80386 (1985) could host a modern 32-bit operating system.

Later chips implemented ISA extensions for multimedia and data movement ...
... and continued to incorporate microarchitectural innovations.

80486 (1989), Pentium (1992), Pentium Pro (1995), Pentium II (1997), Pentium III (1999), Pentium 4 (2000), Core Duo (2006), ...

Unlike System/360, the way it would be used was not foreseen.

Includes unpopular features, such as small memory segments.

Nevertheless, implementations have competed well with modern ISAs.

Architecture: DEC (then Compaq, now HP) *Alpha*

An example of a *RISC* processor.

Designed for easy programming.

Designed for easy implementation.

RISC programs are larger than others, but run faster.

Developed for a 25-year lifetime.

First implementation: DECchip 21064 (1992).

Later implementations: 21264, 21364.

Implementations are usually the fastest processors.

Alas, Compaq plans to discontinue it.

Architecture: *Itanium* (née IA-64)

First general purpose *VLIW* ISA.

ISA helps processor overcome problems in turn-of-the-century processors.

First implementation: Itanium (same name as architecture) (2000).

Radically different from other processors.

So far unproven.

This Course

ISA Features and Families

Reference ISA: MIPS 32

Families: RISC, CISC, VLIW

Features: Common to the semi-exotic.

Specific: SPARC, Itanium, VAX, PowerPC

Microarchitecture (Implementation Techniques)

Basic Pipelining

Multiple Issue (Superscalar)

Branch Prediction

Dynamic Scheduling (Out-of-order execution.)

Memory and Caches
