Lessons Learned from the Shared Memory Parallelization of a Functional Array Language

Clemens Grelck
University of Lübeck, Germany

Outline of Talk:

* Functional array programming with SAC.
* Choosing shared memory systems.
* Organization of parallel program execution.
* Architecture-specific pitfalls.
* Conclusion: lessons learned.

Functional Array Programming in SAC

Characteristics:

* Array: multidimensional abstract data structure.
* Array: data vector + shape vector.
* Creation / projection facilities.
* Call-by-value parameter passing.
* Memory management by compiler / runtime system.

Example:

```
bool continue( double[+] A, double[+] A_old, double eps)
{
  return( any( abs( A - A_old) >= eps));
}
```

The With-Loop Construct

Example:

```
bool[+] >= ( double[+] A, double b)
{
  res = with (. <= i_vec <= .) : A[i_vec] >= b ;
        genarray( shape( A));

  return( res);
}
```

In general:

```
res = with  index_set_1  :  expr_1  ;
                ...            ...
            index_set_n  :  expr_n  ;
        genarray(  shp_expr  );
```

Parallelization for Shared Memory

What everyone does:

* Message passing / MPI

What we do:

* Multithreading / PThreads

Pragmatics:

* No explicit data decomposition:
  $\Longrightarrow$ adopt sequential memory data layout.

* Only array operations affected:
  $\Longrightarrow$ sequential code for I/O, etc. remains as is.
  $\Longrightarrow$ focus on compilation of with-loops.
  $\Longrightarrow$ partly reuse existing sequential compilation scheme.

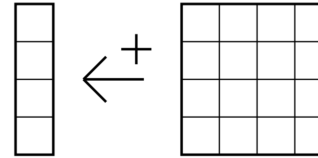
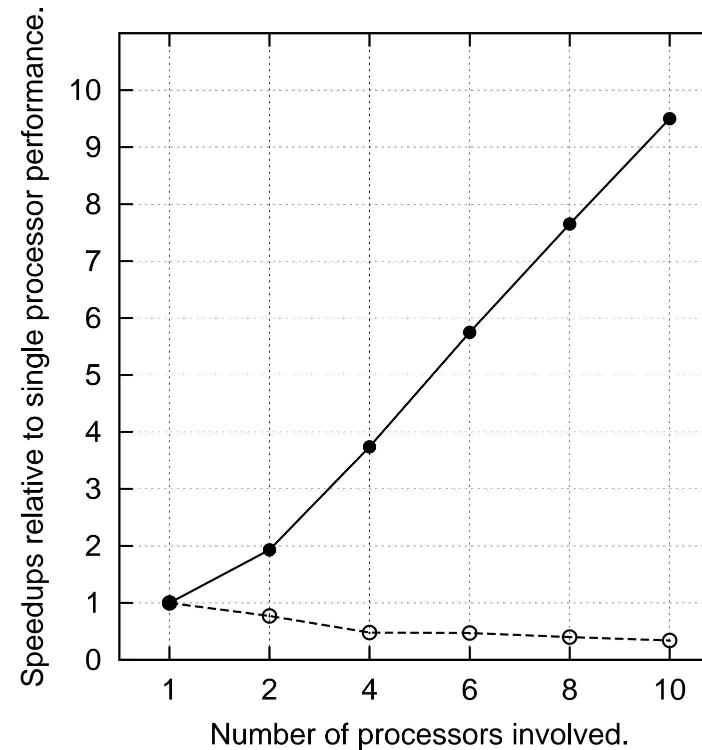
Private Memory Manager

Sum 2:





Organization:

* Hierarchy of nested heaps.
* Private subheaps for individual threads.
* Tight integration into runtime system.
* Exploitation of compile time knowledge.
* Exploitation of runtime knowledge.

Performance Impact of Cache Memories

* 3-dimensional relaxation kernel.
* Systematic variation of grid size: 16^3 (32KB) $\longrightarrow$ 528^3 (1.2GB)

Time to update single grid point:

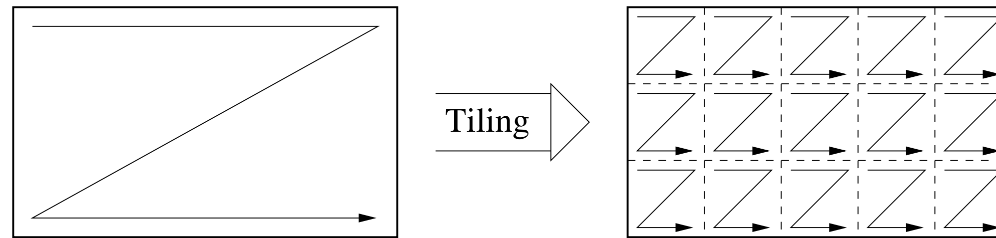
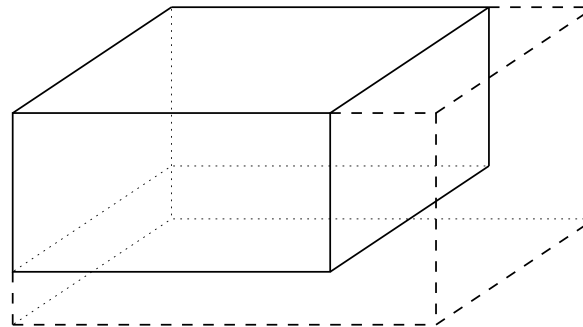
Cache Optimizations

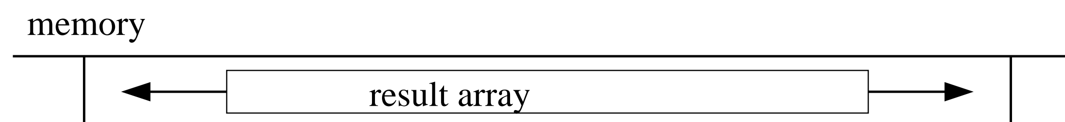
With-Loop Tiling:



Array Padding:



Array Placement:



Clemens Grelck
Institute for Software Technology and Programming Languages
University of Lübeck, Germany

Performance Impact of Cache Optimizations

* **Padding:** 25 out of 33 problem sizes
* **Tiling:** 19 out of 33 problem sizes
* **Placement:** always

Conclusion

Fairly simple:

* **Non-sequential program execution**
  - ⟹ Functional approach pays off.
  - ⟹ Shared memory architecture pays off.

Fairly difficult:

* **Achieving desired speedups**
  - ⟹ Fine-tuned runtime system.
  - ⟹ Tailor-made dynamic memory management.
  - ⟹ Various cache optimizations.
