

Analog Lowpass Filter Specifications

- Typical magnitude response $|H_a(j\Omega)|$ of an analog lowpass filter may be given as indicated below

1

Copyright © 2005, S. K. Mitra

Analog Lowpass Filter Specifications

- In the **passband**, defined by $0 \leq \Omega \leq \Omega_p$, we require

$$1 - \delta_p \leq |H_a(j\Omega)| \leq 1 + \delta_p, \quad |\Omega| \leq \Omega_p$$

i.e., $|H_a(j\Omega)|$ approximates unity within an error of $\pm \delta_p$

- In the **stopband**, defined by $\Omega_s \leq \Omega \leq \infty$, we require

$$|H_a(j\Omega)| \leq \delta_s, \quad \Omega_s \leq |\Omega| \leq \infty$$

i.e., $|H_a(j\Omega)|$ approximates zero within an error of δ_s

2

Copyright © 2005, S. K. Mitra

Analog Lowpass Filter Specifications

- Ω_p - **passband edge frequency**
- Ω_s - **stopband edge frequency**
- δ_p - **peak ripple value** in the passband
- δ_s - **peak ripple value** in the stopband

- Peak passband ripple**

$$\alpha_p = -20 \log_{10}(1 - \delta_p) \text{ dB}$$

- Minimum stopband attenuation**

$$\alpha_s = -20 \log_{10}(\delta_s) \text{ dB}$$

3

Analog Lowpass Filter Specifications

- Magnitude specifications may alternately be given in a normalized form as indicated below

4

Copyright © 2005, S. K. Mitra

Analog Lowpass Filter Specifications

- Here, the maximum value of the magnitude in the passband assumed to be unity

- $1/\sqrt{1+\epsilon^2}$ - Maximum passband deviation, given by the minimum value of the magnitude in the passband

- $1/A$ - Maximum stopband magnitude

5

Copyright © 2005, S. K. Mitra

Analog Lowpass Filter Design

- Two additional parameters are defined -

(1) **Transition ratio** $k = \frac{\Omega_p}{\Omega_s}$

For a lowpass filter $k < 1$

(2) **Discrimination parameter** $k_1 = \frac{\epsilon}{\sqrt{A^2 - 1}}$
Usually $k_1 \ll 1$

6

Copyright © 2005, S. K. Mitra

Butterworth Approximation

- The magnitude-square response of an N -th order analog lowpass **Butterworth filter** is given by

$$|H_a(j\Omega)|^2 = \frac{1}{1 + (\Omega/\Omega_c)^{2N}}$$

- First $2N - 1$ derivatives of $|H_a(j\Omega)|^2$ at $\Omega = 0$ are equal to zero
- The Butterworth lowpass filter thus is said to have a **maximally-flat magnitude** at $\Omega = 0$

7

Copyright © 2005, S. K. Mitra

Butterworth Approximation

- Gain in dB is $G(\Omega) = 10 \log_{10} |H_a(j\Omega)|^2$
- As $G(0) = 0$ and $G(\Omega_c) = 10 \log_{10}(0.5) = -3.0103 \approx -3$ dB Ω_c is called the **3-dB cutoff frequency**

8

Copyright © 2005, S. K. Mitra

Butterworth Approximation

- Typical magnitude responses with $\Omega_c = 1$

9

Copyright © 2005, S. K. Mitra

Butterworth Approximation

- Two parameters completely characterizing a Butterworth lowpass filter are Ω_c and N
- These are determined from the specified bandedges Ω_p and Ω_s , and minimum passband magnitude $1/\sqrt{1 + \epsilon^2}$, and maximum stopband ripple $1/A$

10

Copyright © 2005, S. K. Mitra

Butterworth Approximation

- Ω_c and N are thus determined from

$$|H_a(j\Omega_p)|^2 = \frac{1}{1 + (\Omega_p/\Omega_c)^{2N}} = \frac{1}{1 + \epsilon^2}$$

$$|H_a(j\Omega_s)|^2 = \frac{1}{1 + (\Omega_s/\Omega_c)^{2N}} = \frac{1}{A^2}$$

- Solving the above we get

$$N = \frac{1}{2} \cdot \frac{\log_{10}[(A^2 - 1)/\epsilon^2]}{\log_{10}(\Omega_s/\Omega_p)} = \frac{\log_{10}(1/k_1)}{\log_{10}(1/k)}$$

11

Copyright © 2005, S. K. Mitra

Butterworth Approximation

- Since order N must be an integer, value obtained is rounded up to the next highest integer
- This value of N is used next to determine Ω_c by satisfying either the stopband edge or the passband edge specification exactly
- If the stopband edge specification is satisfied, then the passband edge specification is exceeded providing a safety margin

12

Copyright © 2005, S. K. Mitra

Butterworth Approximation

- Transfer function of an analog Butterworth lowpass filter is given by

$$H_a(s) = \frac{C}{D_N(s)} = \frac{\Omega_c^N}{s^N + \sum_{\ell=0}^{N-1} d_\ell s^\ell} = \frac{\Omega_c^N}{\prod_{\ell=1}^N (s - p_\ell)}$$

where

$$p_\ell = \Omega_c e^{j[\pi(N+2\ell-1)/2N]}, \quad 1 \leq \ell \leq N$$

- Denominator $D_N(s)$ is known as the **Butterworth polynomial** of order N

13

Copyright © 2005, S. K. Mitra

Butterworth Approximation

- Example** - Determine the lowest order of a Butterworth lowpass filter with a 1-dB cutoff frequency at 1 kHz and a minimum attenuation of 40 dB at 5 kHz

Now $10 \log_{10} \left(\frac{1}{1 + \varepsilon^2} \right) = -1$

which yields $\varepsilon^2 = 0.25895$

and $10 \log_{10} \left(\frac{1}{A^2} \right) = -40$

which yields $A^2 = 10,000$

14

Copyright © 2005, S. K. Mitra

Butterworth Approximation

• Therefore $\frac{1}{k_1} = \frac{\sqrt{A^2 - 1}}{\varepsilon} = 196.51334$

and $\frac{1}{k} = \frac{\Omega_s}{\Omega_p} = 5$

- Hence

$$N = \frac{\log_{10}(1/k_1)}{\log_{10}(1/k)} = 3.2811$$

- We choose $N = 4$

15

Copyright © 2005, S. K. Mitra

Chebyshev Approximation

- The magnitude-square response of an N -th order analog lowpass **Type 1 Chebyshev filter** is given by

$$|H_a(s)|^2 = \frac{1}{1 + \varepsilon^2 T_N^2(\Omega/\Omega_p)}$$

where $T_N(\Omega)$ is the **Chebyshev polynomial** of order N :

$$T_N(\Omega) = \begin{cases} \cos(N \cos^{-1} \Omega), & |\Omega| \leq 1 \\ \cosh(N \cosh^{-1} \Omega), & |\Omega| > 1 \end{cases}$$

16

Copyright © 2005, S. K. Mitra

Chebyshev Approximation

- Typical magnitude response plots of the analog lowpass **Type 1 Chebyshev filter** are shown below

17

Copyright © 2005, S. K. Mitra

Chebyshev Approximation

- If at $\Omega = \Omega_s$ the magnitude is equal to $1/A$, then

$$|H_a(j\Omega_s)|^2 = \frac{1}{1 + \varepsilon^2 T_N^2(\Omega_s/\Omega_p)} = \frac{1}{A^2}$$

- Solving the above we get

$$N = \frac{\cosh^{-1}(\sqrt{A^2 - 1}/\varepsilon)}{\cosh^{-1}(\Omega_s/\Omega_p)} = \frac{\cosh^{-1}(1/k_1)}{\cosh^{-1}(1/k)}$$

- Order N is chosen as the nearest integer greater than or equal to the above value

18

Copyright © 2005, S. K. Mitra

Chebyshev Approximation

- The magnitude-square response of an N -th order analog lowpass **Type 2 Chebyshev** (also called **inverse Chebyshev**) filter is given by

$$|H_a(j\Omega)|^2 = \frac{1}{1 + \varepsilon^2 \left[\frac{T_N(\Omega_s/\Omega_p)}{T_N(\Omega_s/\Omega)} \right]^2}$$

where $T_N(\Omega)$ is the **Chebyshev polynomial** of order N

19

Copyright © 2005, S. K. Mitra

Chebyshev Approximation

- Typical magnitude response plots of the analog lowpass **Type 2 Chebyshev filter** are shown below

20

Copyright © 2005, S. K. Mitra

Chebyshev Approximation

- The order N of the **Type 2 Chebyshev filter** is determined from given ε , Ω_s , and A using

$$N = \frac{\cosh^{-1}(\sqrt{A^2 - 1}/\varepsilon)}{\cosh^{-1}(\Omega_s/\Omega_p)} = \frac{\cosh^{-1}(1/k_1)}{\cosh^{-1}(1/k)}$$

- Example** - Determine the lowest order of a Chebyshev lowpass filter with a 1-dB cutoff frequency at 1 kHz and a minimum attenuation of 40 dB at 5 kHz -

$$N = \frac{\cosh^{-1}(1/k_1)}{\cosh^{-1}(1/k)} = 2.6059$$

21

Copyright © 2005, S. K. Mitra

Elliptic Approximation

- The square-magnitude response of an elliptic lowpass filter is given by

$$|H_a(j\Omega)|^2 = \frac{1}{1 + \varepsilon^2 R_N^2(\Omega/\Omega_p)}$$

where $R_N(\Omega)$ is a rational function of order N satisfying $R_N(1/\Omega) = 1/R_N(\Omega)$, with the roots of its numerator lying in the interval $0 < \Omega < 1$ and the roots of its denominator lying in the interval $1 < \Omega < \infty$

22

Copyright © 2005, S. K. Mitra

Elliptic Approximation

- For given Ω_p , Ω_s , ε , and A , the filter order can be estimated using

$$N \cong \frac{2 \log_{10}(4/k_1)}{\log_{10}(1/\rho)}$$

where $k' = \sqrt{1 - k^2}$

$$\rho_0 = \frac{1 - \sqrt{k'}}{2(1 + \sqrt{k'})}$$

$$\rho = \rho_0 + 2(\rho_0)^5 + 15(\rho_0)^9 + 150(\rho_0)^{13}$$

23

Copyright © 2005, S. K. Mitra

Elliptic Approximation

- Example** - Determine the lowest order of an elliptic lowpass filter with a 1-dB cutoff frequency at 1 kHz and a minimum attenuation of 40 dB at 5 kHz
Note: $k = 0.2$ and $1/k_1 = 196.5134$

- Substituting these values we get

$$k' = 0.979796, \quad \rho_0 = 0.00255135, \\ \rho = 0.0025513525$$

- and hence $N = 2.23308$
- Choose $N = 3$

24

Copyright © 2005, S. K. Mitra

Elliptic Approximation

- Typical magnitude response plots with $\Omega_p = 1$ are shown below

25

Copyright © 2005, S. K. Mitra

Analog Lowpass Filter Design

- Example** - Design an elliptic lowpass filter of lowest order with a 1-dB cutoff frequency at 1 kHz and a minimum attenuation of 40 dB at 5 kHz

- Code fragments used

```
[N, Wn] = ellipord(Wp, Ws, Rp, Rs, 's');
[b, a] = ellip(N, Rp, Rs, Wn, 's');
with Wp = 2*pi*1000;
     Ws = 2*pi*5000;
     Rp = 1;
     Rs = 40;
```

Design of Analog Highpass, Bandpass and Bandstop Filters

- Steps involved in the design process:

Step 1 - Develop of specifications of a prototype analog lowpass filter $H_{LP}(s)$ from specifications of desired analog filter $H_D(s)$ using a frequency transformation

Step 2 - Design the prototype analog lowpass filter

Step 3 - Determine the transfer function $H_D(s)$ of desired analog filter by applying the inverse frequency transformation to $H_{LP}(s)$

28

Copyright © 2005, S. K. Mitra

Design of Analog Highpass, Bandpass and Bandstop Filters

- Let s denote the Laplace transform variable of prototype analog lowpass filter $H_{LP}(s)$ and \hat{s} denote the Laplace transform variable of desired analog filter $H_D(\hat{s})$
- The mapping from s -domain to \hat{s} -domain is given by the invertible transformation

$$s = F(\hat{s})$$

- Then $H_D(\hat{s}) = H_{LP}(s)|_{s=F(\hat{s})}$
 $H_{LP}(s) = H_D(\hat{s})|_{\hat{s}=F^{-1}(s)}$

29

Copyright © 2005, S. K. Mitra

Analog Highpass Filter Design

- Spectral Transformation:

$$s = \frac{\Omega_p \hat{\Omega}_p}{\hat{s}}$$

where Ω_p is the passband edge frequency of $H_{LP}(s)$ and $\hat{\Omega}_p$ is the passband edge frequency of $H_{HP}(\hat{s})$

- On the imaginary axis the transformation is

$$\Omega = -\frac{\Omega_p \hat{\Omega}_p}{\hat{\Omega}}$$

Analog Highpass Filter Design

31

Copyright © 2005, S. K. Mitra

Analog Highpass Filter Design

- **Example - Design an analog Butterworth highpass filter with the specifications:**

$$\hat{F}_p = 4 \text{ kHz}, \hat{F}_s = 1 \text{ kHz}, \alpha_p = 0.1 \text{ dB}, \alpha_s = 40 \text{ dB}$$

- Choose $\Omega_p = 1$

$$\Omega_s = \frac{2\pi\hat{F}_p}{2\pi\hat{F}_s} = \frac{\hat{F}_p}{\hat{F}_s} = \frac{4000}{1000} = 4$$

- Analog lowpass filter specifications: $\Omega_p = 1$, $\Omega_s = 4$, $\alpha_p = 0.1 \text{ dB}$, $\alpha_s = 40 \text{ dB}$

32

Copyright © 2005, S. K. Mitra

Analog Highpass Filter Design

- **Code fragments used**

```
[N, Wn] = buttord(1, 4, 0.1, 40, 's');
```

```
[B, A] = butter(N, Wn, 's');
```

```
[num, den] = lp2hp(B, A, 2*pi*4000);
```

- **Gain plots**

33

Analog Bandpass Filter Design

- **Spectral Transformation**

$$s = \Omega_p \frac{\hat{s}^2 + \hat{\Omega}_o^2}{\hat{s}(\hat{\Omega}_{p2} - \hat{\Omega}_{p1})}$$

where Ω_p is the passband edge frequency of $H_{LP}(s)$, and $\hat{\Omega}_{p1}$ and $\hat{\Omega}_{p2}$ are the lower and upper passband edge frequencies of desired bandpass filter $H_{BP}(\hat{s})$

34

Copyright © 2005, S. K. Mitra

Analog Bandpass Filter Design

- On the imaginary axis the transformation is

$$\Omega = -\Omega_p \frac{\hat{\Omega}_o^2 - \hat{\Omega}^2}{\hat{\Omega} B_w}$$

where $B_w = \hat{\Omega}_{p2} - \hat{\Omega}_{p1}$ is the width of passband and $\hat{\Omega}_o$ is the **passband center frequency** of the bandpass filter

- Passband edge frequency $\pm \Omega_p$ is mapped into $\mp \hat{\Omega}_{p1}$ and $\pm \hat{\Omega}_{p2}$, lower and upper passband edge frequencies

35

Copyright © 2005, S. K. Mitra

Analog Bandpass Filter Design

$$\Omega = -\Omega_p \frac{\hat{\Omega}_o^2 - \hat{\Omega}^2}{\hat{\Omega} B_w}$$

36

Analog Bandpass Filter Design

- Stopband edge frequency $\pm\Omega_s$ is mapped into $\mp\hat{\Omega}_{s1}$ and $\pm\hat{\Omega}_{s2}$, lower and upper stopband edge frequencies
- Also,

$$\hat{\Omega}_o^2 = \hat{\Omega}_{p1}\hat{\Omega}_{p2} = \hat{\Omega}_{s1}\hat{\Omega}_{s2}$$
- If bandedge frequencies do not satisfy the above condition, then one of the frequencies needs to be changed to a new value so that the condition is satisfied

37

Copyright © 2005, S. K. Mitra

Analog Bandpass Filter Design

- **Case 1:** $\hat{\Omega}_{p1}\hat{\Omega}_{p2} > \hat{\Omega}_{s1}\hat{\Omega}_{s2}$
To make $\hat{\Omega}_{p1}\hat{\Omega}_{p2} = \hat{\Omega}_{s1}\hat{\Omega}_{s2}$ we can either increase any one of the stopband edges or decrease any one of the passband edges as shown below

38

Copyright © 2005, S. K. Mitra

Analog Bandpass Filter Design

- (1) Decrease $\hat{\Omega}_{p1}$ to $\hat{\Omega}_{s1}\hat{\Omega}_{s2} / \hat{\Omega}_{p2}$
 \Rightarrow larger passband and shorter leftmost transition band
- (2) Increase $\hat{\Omega}_{s1}$ to $\hat{\Omega}_{p1}\hat{\Omega}_{p2} / \hat{\Omega}_{s2}$
 \Rightarrow No change in passband and shorter leftmost transition band

39

Copyright © 2005, S. K. Mitra

Analog Bandpass Filter Design

- **Note:** The condition $\hat{\Omega}_o^2 = \hat{\Omega}_{p1}\hat{\Omega}_{p2} = \hat{\Omega}_{s1}\hat{\Omega}_{s2}$ can also be satisfied by decreasing $\hat{\Omega}_{p2}$ which is not acceptable as the passband is reduced from the desired value
- Alternately, the condition can be satisfied by increasing $\hat{\Omega}_{s2}$ which is not acceptable as the upper stop band is reduced from the desired value

40

Copyright © 2005, S. K. Mitra

Analog Bandpass Filter Design

- **Case 2:** $\hat{\Omega}_{p1}\hat{\Omega}_{p2} < \hat{\Omega}_{s1}\hat{\Omega}_{s2}$
To make $\hat{\Omega}_{p1}\hat{\Omega}_{p2} = \hat{\Omega}_{s1}\hat{\Omega}_{s2}$ we can either decrease any one of the stopband edges or increase any one of the passband edges as shown below

41

Copyright © 2005, S. K. Mitra

Analog Bandpass Filter Design

- (1) Increase $\hat{\Omega}_{p2}$ to $\hat{\Omega}_{s1}\hat{\Omega}_{s2} / \hat{\Omega}_{p1}$
 \Rightarrow larger passband and shorter rightmost transition band
- (2) Decrease $\hat{\Omega}_{s2}$ to $\hat{\Omega}_{p1}\hat{\Omega}_{p2} / \hat{\Omega}_{s1}$
 \Rightarrow No change in passband and shorter rightmost transition band

42

Copyright © 2005, S. K. Mitra

Analog Bandpass Filter Design

- **Note:** The condition $\hat{\Omega}_o^2 = \hat{\Omega}_{p1}\hat{\Omega}_{p2} = \hat{\Omega}_{s1}\hat{\Omega}_{s2}$ can also be satisfied by increasing $\hat{\Omega}_{p1}$ which is not acceptable as the passband is reduced from the desired value
- Alternately, the condition can be satisfied by decreasing $\hat{\Omega}_{s1}$ which is not acceptable as the lower stopband is reduced from the desired value

43

Copyright © 2005, S. K. Mitra

Analog Bandpass Filter Design

- **Example - Design an analog elliptic bandpass filter with the specifications:**
 $\hat{F}_{p1} = 4 \text{ kHz}$, $\hat{F}_{p2} = 7 \text{ kHz}$, $\hat{F}_{s1} = 3 \text{ kHz}$
 $\hat{F}_{s2} = 8 \text{ kHz}$, $\alpha_p = 1 \text{ dB}$, $\alpha_s = 22 \text{ dB}$
- Now $\hat{F}_{p1}\hat{F}_{p2} = 28 \times 10^6$ and $\hat{F}_{s1}\hat{F}_{s2} = 24 \times 10^6$
- Since $\hat{F}_{p1}\hat{F}_{p2} > \hat{F}_{s1}\hat{F}_{s2}$ we choose
 $\hat{F}_{p1} = \hat{F}_{s1}\hat{F}_{s2} / \hat{F}_{p2} = 3.571428 \text{ kHz}$

44

Copyright © 2005, S. K. Mitra

Analog Bandpass Filter Design

- We choose $\Omega_p = 1$
- Hence

$$\Omega_s = \frac{24 - 9}{(25/7) \times 3} = 1.4$$
- Analog lowpass filter specifications: $\Omega_p = 1$,
 $\Omega_s = 1.4$, $\alpha_p = 1 \text{ dB}$, $\alpha_s = 22 \text{ dB}$

45
