Fall 1999 Midterm Exam Review

When / Where

Wednesday, 20 October, 10:40-11:30 CDT

Room EE 145 (Here)

Conditions

Open Book, Open Notes

Bring any amount of books, notes, and other material ...
... as long as they can be carried 100 meters without stopping.

No communication devices.

Format

One or two problems.

One set of short answers.

Resources

Study recommendations: `href = "http://www.ee.lsu.edu/ee4720/exam.html"`

Solved tests and homework:. `href = "http://www.ee.lsu.edu/ee4720/prev.html"`

Study Recommendations

Solve Old Problems

Memorizing solutions is not the same as solving.

Following and understanding solutions is not the same as solving.

Use the solutions for brief hints and to check your own solutions.

Topics

Introductory Material

ISA v. Implementation.

Technological Factors: Transistor speed and quantity, memory speed and size.

Different factors influencing ISA and implementation.

Design principles: Amdahl's law, locality.

CPU Performance Equation

Benchmark types.

Instruction Set Design

Data Types: What to include, what to leave out.

Basic integer and floating point

Packed types: BCD, integer, saturating integer.

Size choices.

Memory and Register Organization: Why ≈ 32 registers?

Stack and accumulator architectures.

Memory/Memory, Register/Memory.

Addressing Modes: What they do, which ones to include.

Register, Immediate, Direct, Register Deferred (Register Indirect), Displacement, Indexed, Memory Indirect, Autoincrement, Autodecrement, Scaled.

Control Transfer Instructions: Types, when to use.

- Branch, Jump, Jump & Link, Call, Return
- Format of displacements in instruction.
- Specification of condition: condition code registers, integer registers, loop counter.
- Delayed and predicated instructions; prediction hints.
- Instruction Coding.
  - Fixed-length, variable-length, and bundled instructions.
  - Splitting of opcode field (as in DLX type-R instructions).
- ISA Classifications: RISC, CISC, VLIW, Stack, Accumulator

Synthetic Instructions

DLX

- Classification: RISC
- Goals: ISA should allow simple, high-speed implementation.
- Instruction types.
- Know how to read and write DLX programs.

Chapter-3 (Static Scheduled) DLX Implementations

- Unpipelined Implementation
- Pipelined Implementations
  - Basic (3-cycle branch delay).
  - One-cycle branch delay.
  - Bypassed.

Hazard Definitions

For a Given Pipelined Implementations

- Show pipeline execution diagrams.
- Show register contents at any cycle.
- Determine control hardware.
- Determine CPI.

Interrupts, Exceptions, Traps

- Difference between interrupt, exception, trap.
- Causes of exceptions, role of handler.
- Privileged Mode.
- Pipeline activity leading to execution of handler.
- Vectored traps (using trap table).
- Precise exceptions, achieving with floating-point operations.

mr-9

Long Latency Operations

Types of operations. (Floating point and maybe load.)

Degree of pipelining: Initiation interval, latency.

Detecting functional unit structural hazards.

Detecting WB structural hazards: reservation register.

Detecting and handling RAW hazards: ID-stage v. pre-WB stall.

Handling WAW hazards.

Instruction-Level Parallelism

Definition, analysis.

Dependency definitions.

Basic block definition.

EE 4720 Lecture Transparency. Formatted 11:41, 18 October 1999 from lslimr.
